

The Rigby ProClamp is supplied with a Gitzo 3/8" threaded plate as standard.

You can leave it in place or remove it and attach it to your Wimberley Gimbal Head or Ballhead base for quick installation out on location.

It can also be removed and replaced if required with:

1/ The specially made ProClamp Monopod Attachment for situations where your location shelf or other fixture position needs extra support.

2/ A Gitzo GS3512S Carbon Fibre Rapid Column which will give you extra height or width adjustment from the ProClamp position.

N.B. The Gitzo Plate and other accessories are held in place by the small black screw knob at the rear which only needs to be turned approx six times between the locked and open positions.

It is recommended to leave it in the ProClamp at all times so it does not get lost.

The Top Grip Block can easily be rotated depending on the type of surface you are clamping to.

One side is flat and the other is 'V' shaped to accommodate round or irregularly shaped posts.

It is released by unscrewing the small black knob, flipping it over and re-screwing it back onto the top plate.

The ProClamp is designed in such a way that it can be used on horizontal or vertical supports.

It is supplied in the horizontal support position as standard but if you need to clamp onto a vertical post or similar it is quick and easy to do so.

Insert the supplied allen key wrench into the large silver screw on the inner face of the ProClamp, half a turn anti-clockwise and it will release the back plate.

Turn the back plate 90° anti-clockwise and it will click to indicate it is in the correct position, then re-tighten the screw.
